1. Introduction

In the modern landscape of commerce, where technology is reshaping industries at an unprecedented pace, the retail sector has emerged as a dynamic hub of transformation. At the heart of this evolution lies the concept of digital transformation, a phenomenon that has redefined the very essence of customer experience within the retail industry. This study delves into the intricate interplay between digital transformation and customer experience, unraveling how the fusion of technology and retail practices has led to novel paradigms of engagement, interaction, and satisfaction.

The retail industry, once characterized by brick-and-mortar stores and traditional shopping models, has undergone a remarkable metamorphosis. As digital technologies have permeated every facet of business operations, retailers have harnessed their power to not only optimize operational efficiency but also to create immersive and tailored experiences for customers. This study seeks to uncover the multifaceted ways in which this transformation has revolutionized the relationship between retailers and their customers, reshaping the expectations, demands, and interactions that define the modern shopping journey. The integration of digital tools and platforms has ushered in a new era of customer engagement. Online storefronts, mobile applications, social media channels, and data-driven marketing strategies have empowered retailers to establish direct and personalized connections with their customers. This study will delve into the implications of these innovations, exploring how they have led to the emergence of seamless, convenient, and customized shopping experiences that cater to the preferences and needs of individual customers.

However, with these advancements come challenges that warrant careful consideration. The study will not only highlight the opportunities presented by digital transformation but also

scrutinize the potential pitfalls, such as data security concerns and the imperative for upskilling the workforce to navigate the digital landscape effectively. By addressing these challenges, the study aims to provide a comprehensive view of the factors that contribute to a successful integration of technology for elevating customer experience. Moreover, the study will delve into the role of data analytics and artificial intelligence in shaping customer interactions. As retailers leverage customer data to gain insights into preferences and behaviors, they can offer tailored recommendations and solutions, thereby enhancing the personalization and relevance of their engagement strategies. Additionally, the study will examine the impact of innovative concepts like omni-channel retailing and experiential shopping, exploring how the digital transformation has blurred the lines between online and offline retail experiences.

In essence, this research endeavors to unravel the intricate relationship between digital transformation and customer experience in the retail industry. By examining the fusion of technology, data analytics, AI, and emerging retail paradigms, the study aims to shed light on how businesses can harness the power of digital transformation to redefine customer engagement, adapt to evolving consumer expectations, and ultimately thrive in a landscape where technology and retail seamlessly converge.

2. Review of Literature

Puccinelli et al. (2009) focused on seven consumer behavior research domains that influence the customer experience: (1) goals, schemas, and information processing; (2) memory; (3) involvement; (4) attitudes; (5) affect; (6) atmospherics; and (7) consumer attributions and choices. They illustrate insights gleaned from each topical area, using standard consumer

decision-making stages (i.e., need recognition, information search, evaluation, purchase, and post-purchase).

Fitzgerald et al. (2014) mentioned that new digital technologies, such as social media, mobile technology, analytics, or embedded devices, are utilized in the process known as "digital transformation," which enables significant improvements to be made to businesses, including improved customer experiences. Digital transformation comprises the changes associated with the application of digital technology in all aspects of human society.

Bondar et al (2017) explored that digital transformation is a consistent networking of all economic sectors and an adaption of actors to new circumstances of the digital economy. Digital transformation is an organizational transformation that integrates digital technologies and business processes in a digital economy.

Hinings et al (2018) revealed that digital transformation is the combined effects of several digital innovations bringing about novel actors (and actor constellations), structures, practices, values, and beliefs that change, threaten, replace, or complement existing rules of the game within organizations, ecosystems, industries, or fields.

Chun Lian Chang et al (2021) aimed to discover the barriers, and the roles of government, for digital transformation in small service business. This study applied a qualitative approach involving semi-structured in-depth interviews with top management of small service business. Then, we employed the content analysis method to examine interview data and construct a model. This research reveals four main barriers to digital transformation in small service business: lack of funding, lack of digital capability, lack of human resources, and technical

barriers. The study found there are four government roles for supporting digital transformation in small service business: build a digital platform for small service business, promote mobile/digital payment, provide digital training, and build a digital collaboration ecosystem.

Xu et al. (2022) focused on the significant behavioral variations that exist between customers who shop through traditional offline channels and those who shop through internet channels. For instance, buyers can physically check things and acquire tactile information prior to making a purchase when they shop in a traditional store. In contrast, when consumers shop online, they rely on visual and verbal information about the goods, rather than having the benefit of direct encounter with the product. Considering the basic distinctions between shopping channels that are available online and offline, the authors investigate how different shopping channels influence the psychological processes and shopping behaviors of customers.

3. Research Gap

Despite the growing body of research exploring the impact of digital transformation on various facets of the retail industry, there remains a notable research gap concerning the nuanced mechanisms and moderating factors that influence the extent to which different dimensions of digital transformation, such as e-commerce adoption, personalized marketing strategies, and omni-channel integration, collectively contribute to enhancing the holistic customer experience. Additionally, limited attention has been given to the role of organizational culture and leadership in facilitating or hindering the effective implementation of digital transformation initiatives aimed at elevating customer experiences, highlighting a need for more comprehensive investigations that consider both technological and human-centric aspects within the retail context.

3.1. Conceptual Model of the Study

Figure.1. Conceptual Model of the Study

4. Objectives of the Study

- ❖ To study the factors of digital transformation in the retail industry.
- ❖ To evaluate the relationship between digital transformation and customer experience in the retail industry.
- ❖ To develop a conceptual model to study the role of digital transformation in customer experience.

5. Research Methodology

The research methodology adopted for the study combined quantitative surveys and qualitative interviews to gain comprehensive insights. With an initial target of 250 participants, the study successfully gathered data from 243 respondents.

Structured surveys were employed to collect quantitative data on variables such as brand visibility, customer engagement, and growth outcomes. These surveys were distributed among businesses that have taken business transformation and obtained customer experience in retail industry. The quantitative data collected were analyzed using statistical techniques to establish relationships and correlations between integrated strategies and business outcomes.

In parallel, semi-structured interviews were conducted to delve deeper into participants' experiences and perspectives. The qualitative insights garnered from these interviews provided valuable context to the quantitative findings, offering a well-rounded understanding of the phenomena under investigation.

Ethical considerations were carefully observed throughout the research, ensuring participant confidentiality and obtaining informed consent. This rigorous methodology aimed to uncover meaningful insights into how the integration of social media marketing and franchising influences business growth and customer engagement, contributing to both academic knowledge and practical applications in the business realm.

6. Limitations of the Study

- ❖ The study's findings may be influenced by the limited number of respondents, potentially affecting the generalizability of the results.
- ❖ The study's focus on a specific geographic area may restrict the broader applicability of the findings to other regions or markets.
- ❖ The reliance on self-reported data through surveys could introduce response bias and limit the accuracy of the information collected.
- ❖ The study's duration might not allow for capturing long-term effects, potentially overlooking evolving trends and dynamics.
- ❖ Some relevant variables impacting business growth and engagement might not be included due to constraints.
